The present invention describes therapeutic applications of mature FilnT (mFilNT) for use in the treatment of acute liver failure. Mature FilnT (mFilNT), which is a member of the tumour necrosis factor receptor superfamily, is used for treating acute liver failure, inflammation of the liver, abnormal hepatocyte apoptosis, sepsis, a disorder associated with inflammation, hepatitis, abnormal apoptosis, an ischaemia-associated injury or disorder such as hypercoagulation (including use with inflammation, hepatitis, abnormal apoptosis, an ischaemia-associated correndolytic or anti-thrombolytic agents), reperfusion-associated injury or disorder, Type I diabetes, cancer, cell damage or damage to an confiscant bystander tissue that is induced by a chemotherapeutic agent or therapeutic irradiation, treating haematopoietic progenitor cells that chave been exposed to therapeutic radiation or chemotherapy, aplastic anaemia, myelodysplastic syndrome or a pancytopenic condition. mFLINT is also used for promoting the growth or differentiation of a haematopoietic progenitor cell or CD34+ cell and preventing damage to a cardiac myocyte resulting from abnormal myocardial ischaemia.                                                                                                                    The present sequence represents a mature human FAS Ligand Inhibitory Protein (FLINT). FLINT is a homologue of tumour necrosis factor receptor proteins. FLINT inhibits the binding of FAS to FAS ligand. The mature FLINT protein is modified to produce analogues, which have greater potency, longer in vivo half-lives, decreased aggregation, decreased absorption onto surfaces, increased solubility and improved ease of formulation. The FLINT analogue is useful for treating a patient suffering from disease or condition relating to abnormal apoptosis such as acute lung injury, acute respiratory distress syndrome, pulmonary fibrosis, chronic obstructive pulmonary disease, ulcerative colitis, or
                                                                                                                                                                                                                                                                                                                                                                   Becker GW,

The M68 protein is a member of a family of proteins which have roles in immune responses, cell death, cell proliferation and stimulation of cell differentiation. M68 lacks a transmembrane domain stimulation of cell differentiation. M68 lacks a transmembrane domain and is a secreted factor suggesting that it functions as a natural inhibitor for its ligand. The altered expression pattern of M68 in a multitude of tissues suggests that M68 may play a role in cancer by binding to its ligand and blocking apoptotic cell death induced by such a ligand. This anti-apoptopic role of M68 suggests that modulators of M68 will be useful in treatment of apoptosis-related diseases such as various forms of cancer and various bone disorders. M68 nucleic acids and proteins are therefore useful for treating conditions involving atypical apoptosis and for identifying conditions diseases associated with abnormal levels of

The present sequence is human mature fas ligand inhibitory protein

(FILNT). FLINT, a homologue of tumour necrosis factor receptor

(FILNT). FLINT, binds fas ligand (FasL) and thereby preventing the

protein (TNFR) binds fas ligand (FasL) and thereby preventing the

construction of FasL with fas. FLINT comprising O-linked or N-linked

oligosaccharides is useful for preventing or treating acute lung injury

(ALI), acute respiratory distress syndrome (ARDS), ulcerative colitis,

chronic obstructive pulmonary disease (COPD) and pulmonary fibrosis (PP),

conficiente organ preservation for transplantation and to inhibit T

conficient as rheumatoid arthritis, fibroproliferative lung disease,

fibrocic lung disease, acute lung injury, human immunodeficiency virus

(HIV), ischaemia, brain trauma/Anjury, chronic renal failure, graft-ve-

host disease, cutaneous inflammation, vascular leak syndrome,

CHelicobacter pylori infection, goitre, atherosoflerosis, insulin dependent

diabetes mellitus (IDDM), osteoporosis, inflammatory bowel disease,

Crohn's disease, sepais, pancreatitis, cancer, autoimmune disease such as

Crohn's disease, sepais, pancreatitis, cancer, autoimmune disease

```
The present sequence represents a mature FLINT (FAS Ligand Inhibitory Protein) polypeptide. The specification describers a composition comprising a divalent metal cation and FLINT protein. The composition is used either for reducing, reversing or eliminating aggregation and precipitation of FLINT or for inducing oligomerisation or aggregation of FLINT molecules. They can be used for purifying FLINT and/or maintaining FLINT in solution. The compositions are used to treat and/or prevent disorders associated with the binding of Fas to Fast and/or LIGHT to the LTbetaR and/or FRZ/HVEM receptors. Uses include the treatment of acute liver failure and cerebral ischemia and the prevention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               YCNVI.CGEREEBARACHATHNRACRCRTGFFAHAGFCLEHASCPPGAGVIAPGTPSQNTQ 120

The specification describers a composition comprising a divalent metal cation and FLINT protein. The composition is used either for reducing, reversing or eliminating aggregation and precipitation of FLINT or for inducing oligomerisation or aggregation of FLINT molecules. They can be used for purifying FLINT and/or maintaining FLINT in solution. The compositions are used to treat and/or prevent disorders associated with the binding of Fas to FasL and/or LIGHT to the LTDetaR and/or TR2/HVEM receptors. Uses include the treatment of acute liver failure and cerebral ischemia and the prevention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Compositions comprising a divalent metal cation and a FAS Ligand Inhibitory Protein (FLINT), for reducing or inducing aggregation FLINT and for treating diseases involving FasL/Fas and/or LIGHT/LT-beta-R receptor interactions

The composition is useful in the treatment of diseases associated with Fas binding to its ligand, such as acute liver failure, inflammatory diseases, cerebral ischaemia and apoptosis. The present sequence is the mature FLINT protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

This is the amino acid sequence of the human tumour necrosis related receptor (TR4), used in the method of the invention. The TR4 protein or its agonist can be used to treat a subject in need of enhanced TR4 polypeptide activity. The antagonist is used to inhibit TR4 polypeptide activity. The active agents can be used for the treatment and prevention of diseases such as chronic and acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inflammation, arthritis, septicaemia, autoimmune diseases, transplant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a new method of administering FLINT (FAS ligand inhibitory protein) or FLINT analog that involves pulmonary administration of a therapeutic amount of the FLINT or FLINT analog. The method enables systemic absorption of FLINT through lungs and significantly reduces or eliminates the need for administering FLINT by injection or other routes of administration. The method is useful in treating disorders related to enhanced apoptosis (e.g. organ failure in liver, kidneys and pancreas) and inflammatory diseases associated with neutrophil activation (e.g. sepsis, acute respiratory diserses syndrome, acute lung injury, systemic inflammatory response syndrome (SIRS) and multiple organ dysfunction (MODS)). The method minimises the pain and disconfort of injection methods. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Administering FLINT (FAS ligand inhibitory protein) or FLINT analog, useful for treating e.g. sepsis or respiratory distress syndrome, involves pulmonary administration of a therapeutic amount of the FLINT or FLINT analog -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 YCNVLCGEREEEARACHATHNRACRCRTGFFAHAGFCLEHASCPPGAGVIAPGTPSQNTQ 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ś
                                                                       The present sequence represents the human tumour necrosis factor receptor-6 alpha (TNFR-6 alpha) protein. The invention also provides for the TNFR-6 beta protein (AAW63023). TNFR-6 alpha and TNFR-6 beta are members of the tumour necrosis factor receptor (TNFR) family. TNFRs are expressed in endothelial cells, keratinocytes, normal prostate and prostate tumour tissue. For a number of disorders of these cells, particularly of the immune system, substantially altered (whether increased or decreased) levels of TNFR-6 alpha and/or TNFR-6 beta gene expression can be detected, therefore the TNFR-6 alpha and TNFR-6 beta polypeptides, nucleic acids and antibodies are claimed to be useful in the diagnosis of such disorders. Mutations of the TNFR 6 alpha and TNFR-6 beta genes can also be detected. The TNFR beta polypeptides are also claimed to be useful for identifying ligands which may be useful to be useful for identifying ligands which may be useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide

```

Sequence

This invention describes a novel tumour necrosis factor (TNF) receptor (I) isolated from human lung tissue. (I) is used: (i) to raise specific antibodies (Ab); (ii) to screen for specific (ant)agonists or ligands

expressed from a gene therapy vector) in conditions associated with a deficit of (1). Ab are used: (a) for qualitative or quantitative or deficit of (1). Ab are used: (a) for qualitative or quantitative or cacetion of (1) in standard immunoassays (for diagnosis of disease, or susceptibility, or for monitoring); and (b) as therapeutic inhibitors in cases where (1) is overexpressed. Nucleic acid (11) that encodes (1) is used: (A) for recombinant production of (1); (B) also its oligonucleotide fragments, in standard hybridization and/or amplification assays; (C) as source of antisense molecules or ribozymes; and (D) to produce transgenic animals (for studying (patho) physiology of (1)). Diseases possibly associated with under- or over-expression of (1) are those of the immune, osteogenic, cardiovascular and central or peripheral nervous systems, transplant incompatibility, asthma and rheumatoid arthritis. The products of the invention have antitumnor, antiasthmatic and antiarthritic activity. This sequence represents the TNF-receptor of the

The present invention describes therapeutic applications of mature FLINT (mFLINT) for use in the treatment of acute liver failure. Mature FLINT (mFLINT), which is a member of the tumour necrosis factor receptor (mFLINT), which is a member of the tumour necrosis factor receptor the liver, abnormal hepatocyte apoptosis, adisorder associated with inflammation, hepaticis, abnormal apoptosis, an ischaemia-associated injury or disorder such as hypercoagulation (including use with thrombolytic or anti-thrombolytic agents), reperfusion-associated injury or disorder, Type I diabetes, cancer, cell damage or damage to an classification tissue that is induced by a chemotherapeutic agent or therapeutic irradiation, treating heematopoietic progenitor cells that have been exposed to therapeutic radiation or chemotherapy, aplastic anaemia, myelodysplastic syndrome or a pancytopenic condition. mFLINT is also used for promoting the growth or differentiation of a haematopoietic progenitor cell or CD34+ cell and preventing damage to a cardiac myocyte resulting from abnormal myocardial ischaemia.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a mammalian tumour necrosis factor receptor, designated OPG-2. OPG-2, is a member of the tumour necrosis factor receptor family, and can be used: (i) to raise specific antibodies (Ab), (ii) to treat osteopenic disorders associated with excessive osteoclast activity, e.g. primary osteopyroic metastases; (iii) for affinity purification of malignancy, or osteolyric metastases; (iii) for affinity purification of cognate ligands, and (iv) to screen for ligands (antagonists or agonists). Ab, or other OPG-2 blocking agents such as soluble forms of the protein, are used to prevent, or reduce severity of, an immune response, and for treating cancer. They can also be used in diagnostic assays. The nucleic acid sequence encoding OPG-2 can be used as a probe to isolate related sequences from other species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; Page 18; 22pp; English.
